Benefit of Constant Momentum Propulsion for Large ΔV Missions -- Application to Laser Propulsion

C. William Larson, Franklin B. Mead, Jr., and Sean D. Knecht
Propulsion Directorate
Air Force Research Laboratory
Edwards AFB, CA 93524-7680

42nd AIAA Aerospace Sciences Meeting and Exhibit
4-8 January 2004
Reno, Nevada

Approved for Public Release - Distribution Unlimited

Outline

Tour of White Sands Laboratory (HELSTF/PLVTS) and Video of Flight Testing.

Comparison of Constant Momentum Mission and Constant Specific Impulse Mission. Δv , v_{jet} , f , m_0 , v_0 , P_{jet} , m/E_{jet}

Efficiency of conversion of laser energy to propellant kinetic energy, $\alpha\beta$.

Upper limit to conversion of laser energy to jet kinetic energy from energy conservation and definitions: $Cv_{jet} = \alpha\beta\Phi < 1$.

Comparing momentum quantities to energy quantities. The "Phi Factor" $\Phi = \langle v^2 \rangle / \langle v^2 \rangle$ and velocity distributions in propellant jet. Φ values for delta function, Maxwellian, Gaussian, Chunks and gas, supersonic expansion, etc.

Upper limits to performance based on chemical thermodynamics. Blowdown from defined equilibrium state (u , ρ) of known volume.

Conclusions

Approved for public release; distribution unlimited.

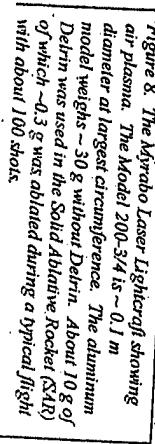

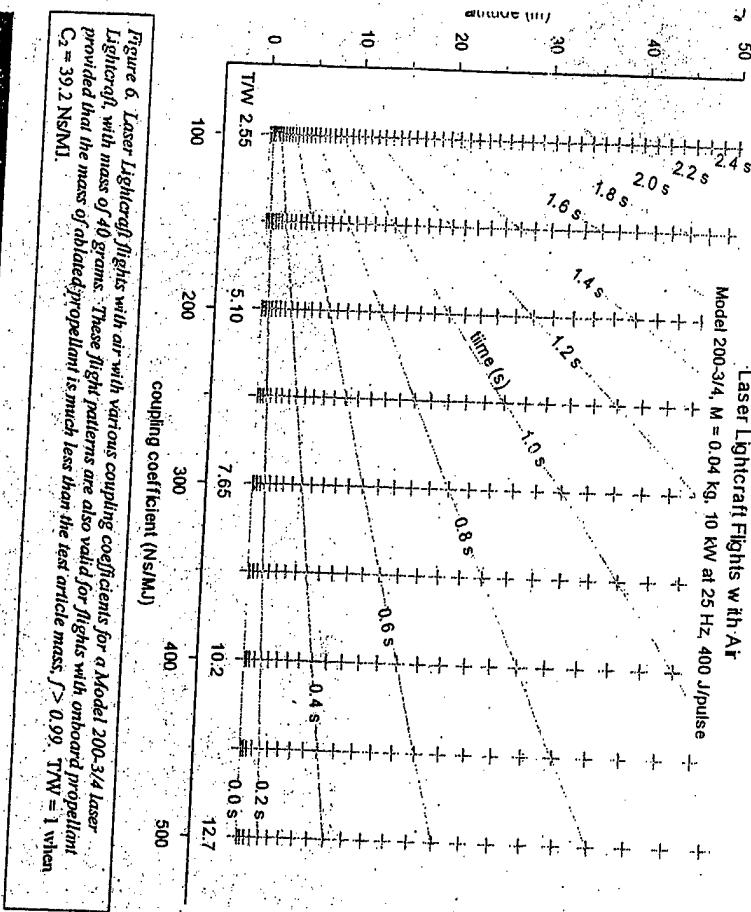

Figure 8. The Myrabo Laser Lightcraft showing air plasma. The Model 200-3/4 is ~ 0.1 m diameter at largest circumference. The aluminum model weighs ~ 30 g without Detrin. About 10 g of which ~0.3 g was ablated during a typical flight with about 100 shots.

Approved for public release; distribution unlimited.

Overall Energy Conversion in Laser Propulsion Mission

$$E_f = \frac{1}{2} m_f v_f^2 = \eta \alpha \beta \gamma \delta E_{wall}$$

η = propulsion efficiency (jet kinetic energy to vehicle kinetic energy)

α = expansion efficiency (internal propellant energy to jet kinetic energy)

β = absorption efficiency (laser energy at vehicle to internal propellant energy)

γ = transmission efficiency (laser energy at ground to laser energy at vehicle)

δ = laser efficiency (electric energy to laser energy at ground)

***** Issue: separability of $\eta \alpha \beta \gamma$ *****

"\$500 worth of electricity to put 1 kg into LEO."

At \$0.10/KWH, \$500 buys 18,000MJ (1 KWH = 3.6 MJ); 1 kg at 10 km/s $\rightarrow E_f = 50$ MJ, so $\eta \alpha \beta \gamma \delta \geq 0.0028$

Phipps, Reilly, Campbell, *Laser & Particle Beams* 18 (2001) 661-695
Pirri, Monsler, Nebolsine, *AIAA Journal* 12 (1974) 1254-1261

Approved for public release; distribution unlimited.

Definitions and Energy Conservation

Propellant Kinetic Energy:

$$E_p = \frac{1}{2} m_p \langle v_e^2 \rangle = \alpha \beta E_L$$

$$\langle v_e^2 \rangle = \frac{\int d(\rho v_e^2)}{\int dp}$$

$$\frac{\rho_f}{\rho_c} \int d(\rho v_e^2)$$

$$\frac{\rho_c}{\rho_f} \int dp$$

Propellant Impulse:

$$I = m_p \langle v_e \rangle$$

$$\langle v_e \rangle = \frac{\int d(\rho v_e)}{\int dp}$$

$$\frac{\rho_f}{\rho_c} \int d(\rho v_e)$$

$$\frac{\rho_c}{\rho_f} \int dp$$

Coupling Coefficient:

$$C = \frac{I}{E_L}$$

$$C = \frac{2\alpha\beta}{\langle v_e \rangle} \left[\frac{\langle v_e \rangle^2}{\langle v_e^2 \rangle} \right] = \frac{2\alpha\beta\Phi}{\langle v_e \rangle}$$

Energy Conservation:

$$\boxed{\alpha\beta\Phi = \frac{I^2}{2m_p E_L} = \frac{CI}{2m_p} = \frac{C \langle v_e \rangle}{2} = \frac{I \langle v_e \rangle}{2E_L} \leq 1}$$

Propellant Internal Energy:

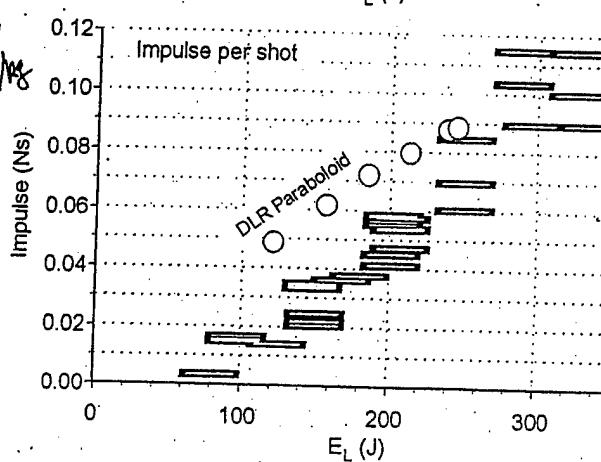

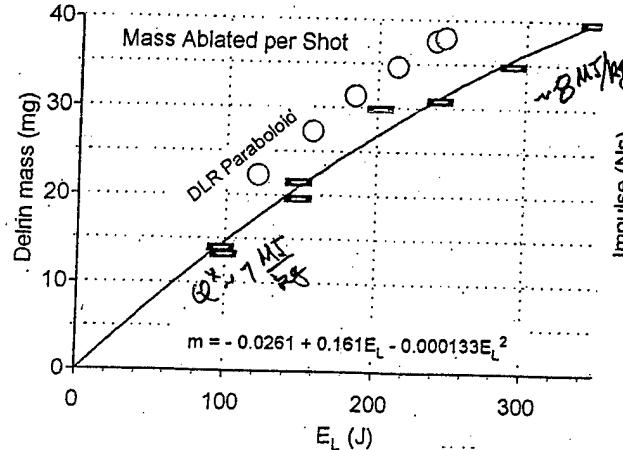

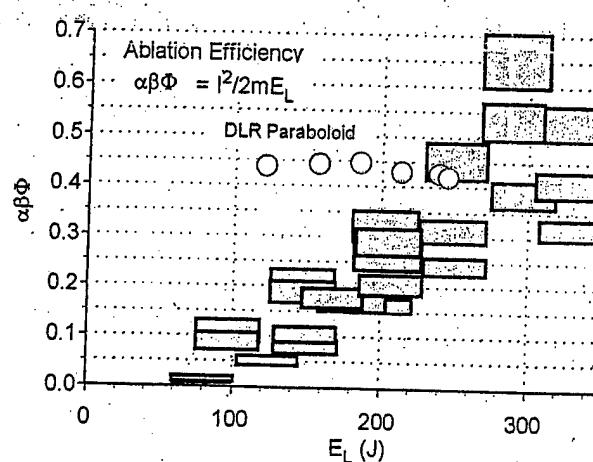

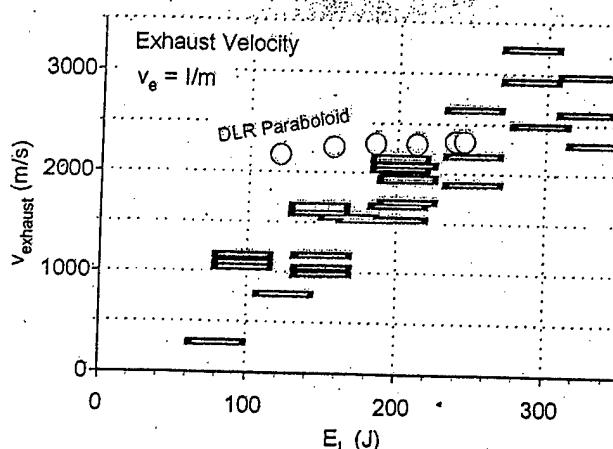

$$Q^* = u_c - u^0 = \frac{\beta E_L}{m_p}$$

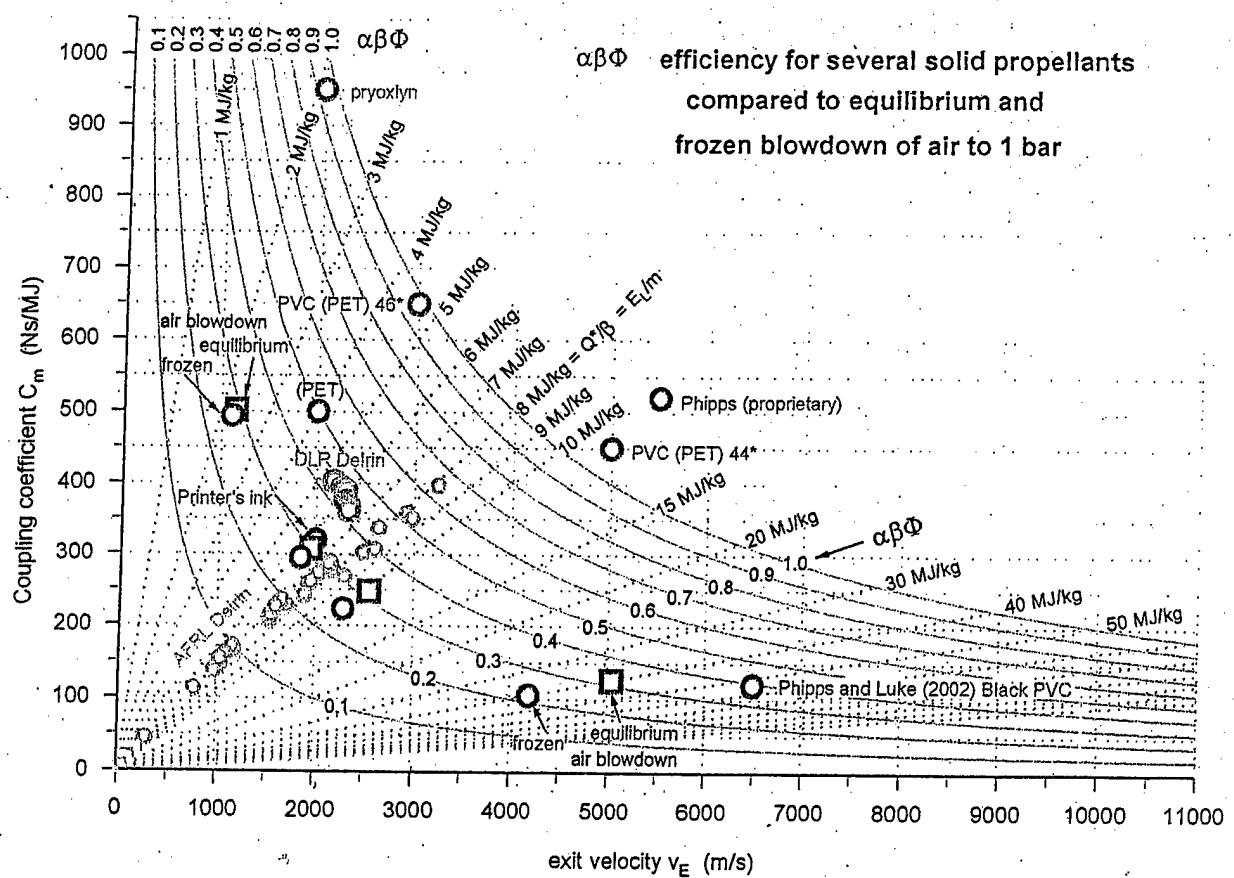

$$C = \frac{\beta \langle v_e \rangle}{u_c - u^0}$$

Propellant with added chemical energy, Δu : $(\alpha\beta\Phi)_{\text{apparent}} = \alpha\Phi(\beta + m_p \Delta u / E_L)$

Approved for public release; distribution unlimited.

INSTANTANEOUS PROPULSION EFFICIENCY

$$\eta_i = \frac{2(v/v_{jet})}{1 + (v/v_{jet})^2}$$

$$\eta_i = 1 \text{ if } v = v_{jet}$$

$$\eta_i < 1 \text{ if } v \neq v_{jet}$$

CONSTANT MOMENTUM COMPARED TO CONSTANT SPECIFIC IMPULSE MISSION

The Constant Specific Impulse Mission

$$\int_{m_0}^m \frac{dm}{m} = -\frac{1}{v_{jet}} \int_{v_0}^v dv$$

$$f = \frac{m}{m_0} = \exp\left(-\frac{v - v_0}{v_{jet}}\right) = \exp\left(\frac{-\Delta v}{v_{jet}}\right)$$

The Constant Momentum Mission

$$\int_{m_0}^m \frac{dm}{m} = -\int_{v_0}^v \frac{dv}{v}$$

$$f' = \frac{m}{m_0} = \frac{v_0}{v} = 1 - \frac{\Delta v}{v} = \left(1 + \frac{\Delta v}{v_0}\right)^{-1} \quad m_0 v_0 = mv$$

Approved for public release; distribution unlimited.

Figures of Merit for Laser Propulsion: m/E_{jet}

The Constant Specific Impulse Mission

$$E_{jet} = -\frac{1}{2} \int_{m_0}^{m_1} v_{jet}^2 dm = \frac{1}{2} (m_0 - m) v_{jet}^2$$

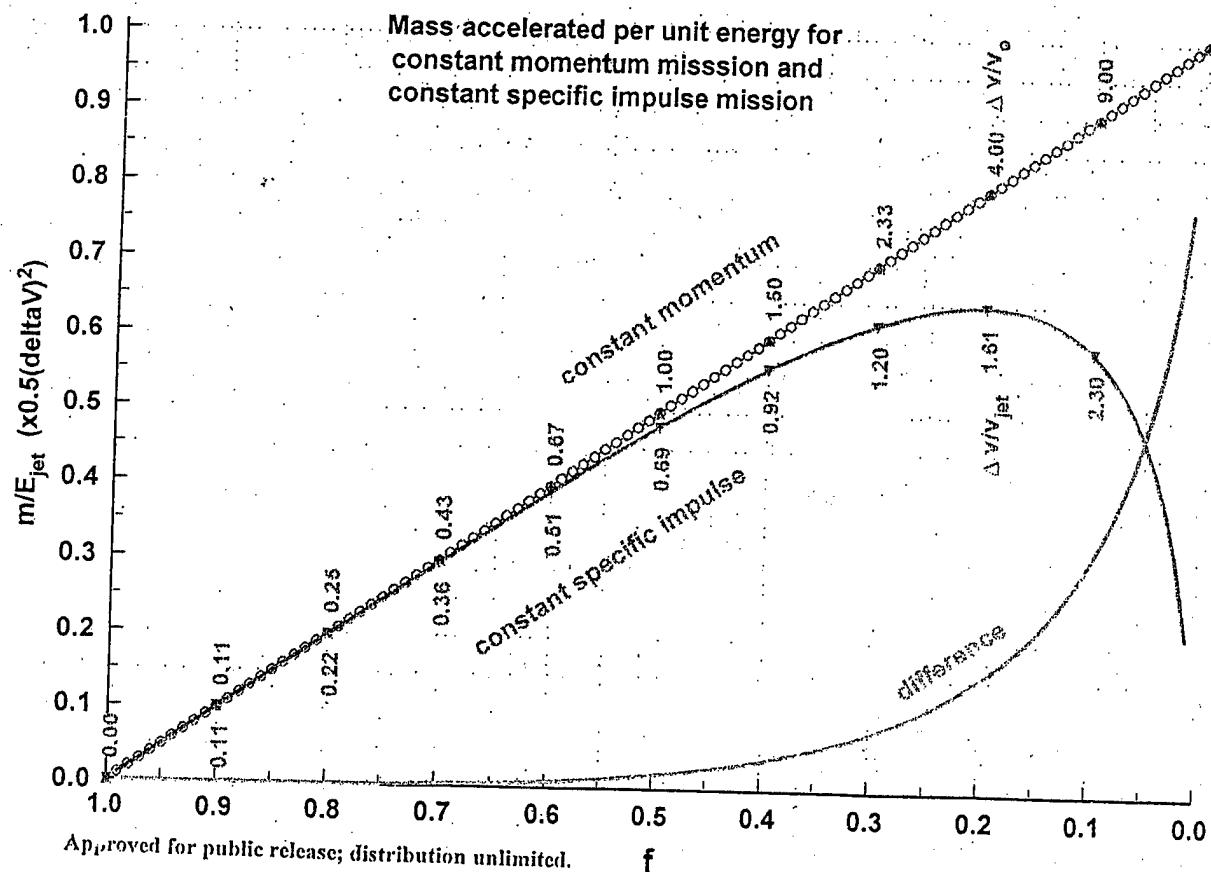

$$B = \frac{m}{\frac{1}{2}(m_0 - m) v_{jet}^2} = \frac{2x^2}{(e^x - 1)[\Delta v]^2} = \frac{2f(\ln f)^2}{(1-f)[\Delta v]^2}$$

The Constant Momentum Mission

$$E_{jet} = -\frac{1}{2} \int_{m_0}^{m_1} v^2 dm = -\frac{1}{2} (m_0 v_0)^2 \int_{m_0}^{m_1} \frac{dm}{m^2} = \frac{1}{2} mv^2 - \frac{1}{2} m_0 v_0^2 = \frac{1}{2} mv \Delta v$$

$$B' = \frac{m}{\frac{1}{2} mv \Delta v} = \frac{2(1-f)}{[\Delta v]^2}$$

Approved for public release; distribution unlimited.

Approved for public release; distribution unlimited.

MISSION TIME FOR CONSTANT SPECIFIC IMPULSE AND CONSTANT MOMENTUM MISSIONS

Constant Specific Impulse

$$P_{jet} = \frac{1}{2} v_{jet}^2 \frac{dm}{dt} = \frac{1}{2} F v_{jet}$$

$$f = \frac{m}{m_0} = 1 - \frac{2P_{jet}}{m_0 v_{jet}^2} t$$

$$t = \frac{m_0}{2P_{jet}} (\Delta v)^2 \frac{(1-f)}{(ln f)^2}$$

$$\Delta v = -v_{jet} \ln \left(1 - \frac{2P_{jet}}{m_0 v_{jet}^2} t \right) = \sqrt{\frac{2P_{jet}}{m_0} \frac{(ln f)^2}{(1-f)}} t = \ln \left(\frac{B P_{jet}}{m_0} t \right) \sqrt{\frac{\frac{2P_{jet}}{m_0}}{\left(1 - \frac{B P_{jet}}{m_0} t \right)}} t$$

Constant Momentum

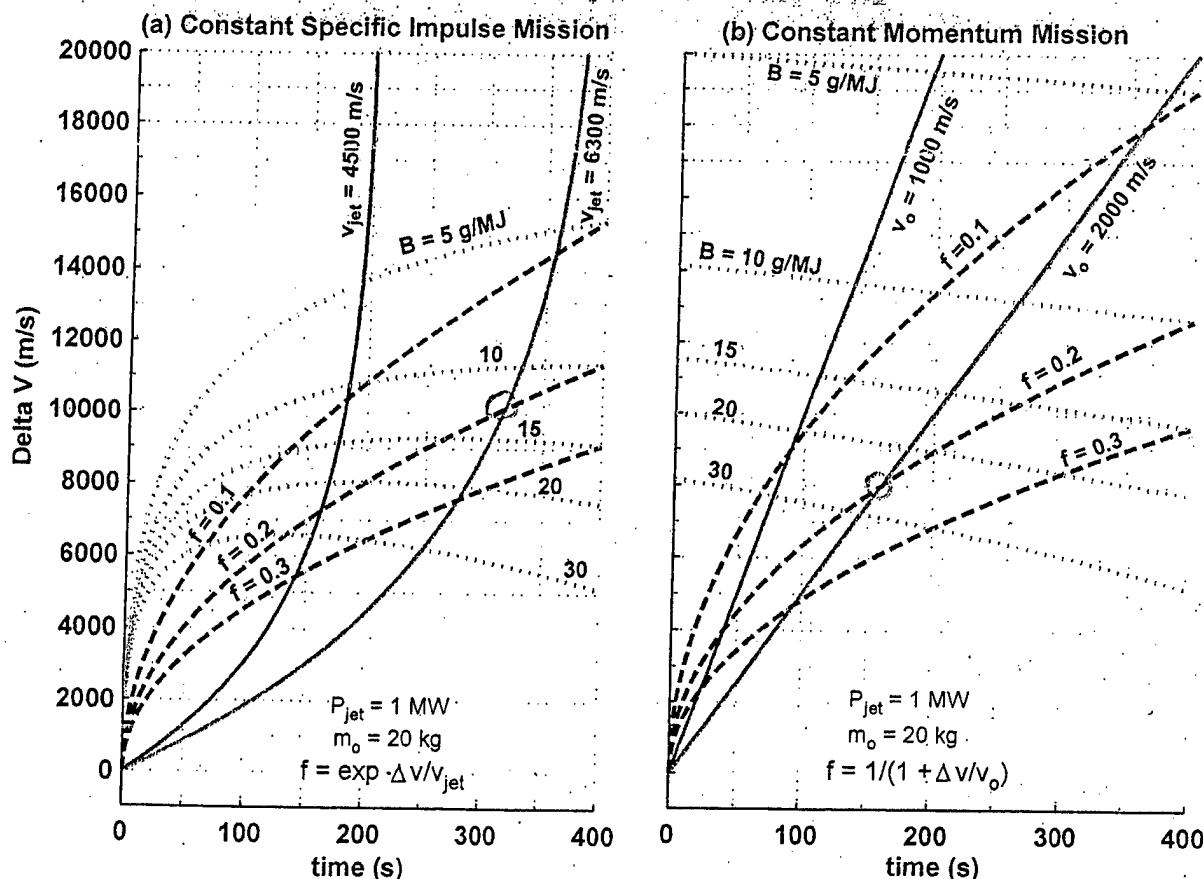

$$P_{jet} = \frac{1}{2} v^2 \frac{dm}{dt} = \frac{1}{2} F v$$

$$f' = \frac{m}{m_0} = \left[1 + \frac{2P_{jet}}{m_0 v_0^2} t' \right]^{-1}$$

$$t' = \frac{m_0}{2P_{jet}} (\Delta' v)^2 \frac{f'}{(1-f')}$$

$$\Delta' v = \frac{2P_{jet}}{m_0 v_0} t' = \sqrt{\frac{2P_{jet}}{m_0} \frac{(1-f')}{f'}} t' = \sqrt{\frac{2}{B'} - \frac{2P_{jet}}{m_0} t'}$$

Conclusions

When $P_{\text{laser}}/m_0 \sim 0.05 \text{ MW/kg}$ small payloads (2 to 4 kg) may be launched into low earth orbit, $\Delta v \sim 10,000 \text{ m/s}$.

At the same mass fraction, $f = 0.2$, m/E_{jet} for constant momentum mission is 23% greater than for constant specific impulse mission.

For $\Delta v = 10,000 \text{ m/s}$, $m_0/P_{\text{jet}} = 20 \text{ kg/MW}$, $f = 0.2$, $v_0 = 0$, the mission time for constant specific impulse propulsion is $\sim 315 \text{ sec}$.

For $\Delta v = 10,000 \text{ m/s}$, $m_0/P_{\text{jet}} = 20 \text{ kg/MW}$, $f = 0.2$, $v_0 = 2000 \text{ m/s}$, the mission time for constant momentum propulsion is $\sim 155 \text{ sec}$.

At the same $m/E_{\text{jet}} = 0.013 \text{ kg/MJ}$ and Δv , $f(\text{constant momentum}) = 0.35$, and $f(\text{constant specific impulse}) = 0.20$.

Based on measured I , E_L , and ablated mass, overall energy conversion efficiencies (laser energy to jet kinetic energy) of $\alpha\beta \sim 50\%$ were obtained with Delrin propellant in the laser lightcraft.

Jet exit velocities of $\sim 2000 \text{ m/s}$ with Delrin (based on measured mass) and $\sim 3000 \text{ m/s}$ with air (based on estimated mass).

Approved for public release; distribution unlimited.

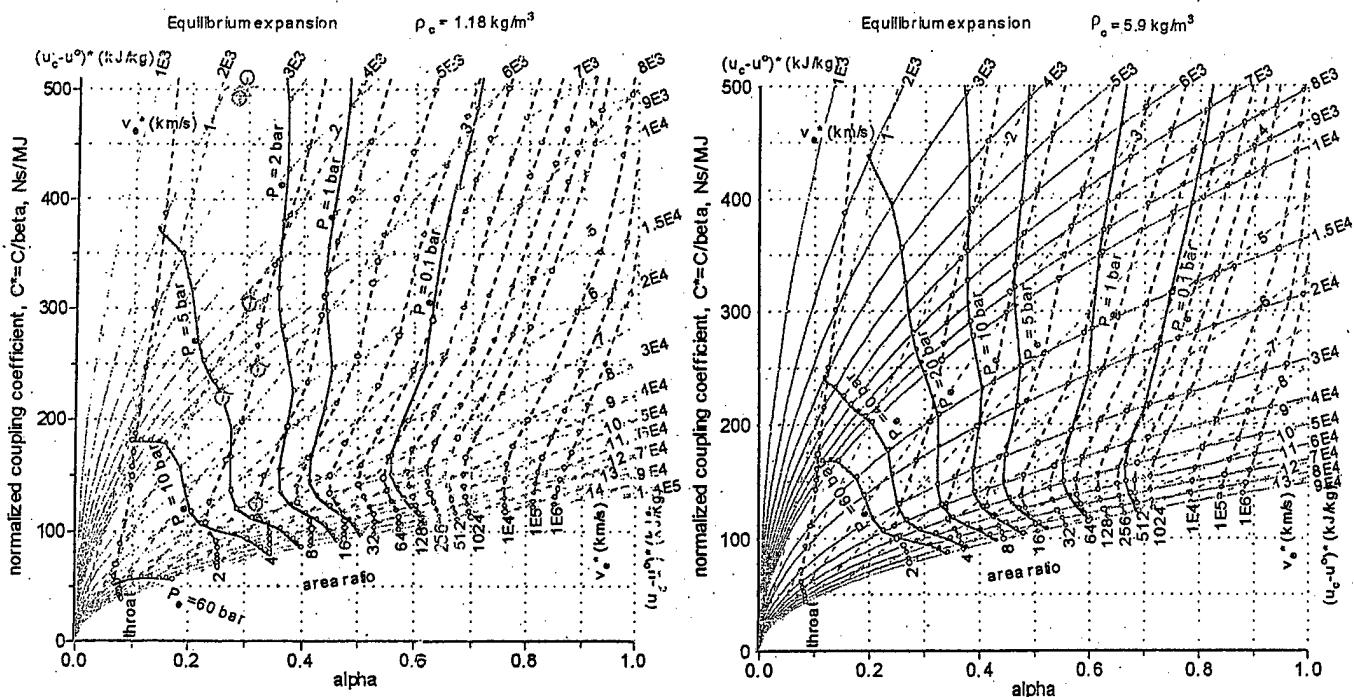

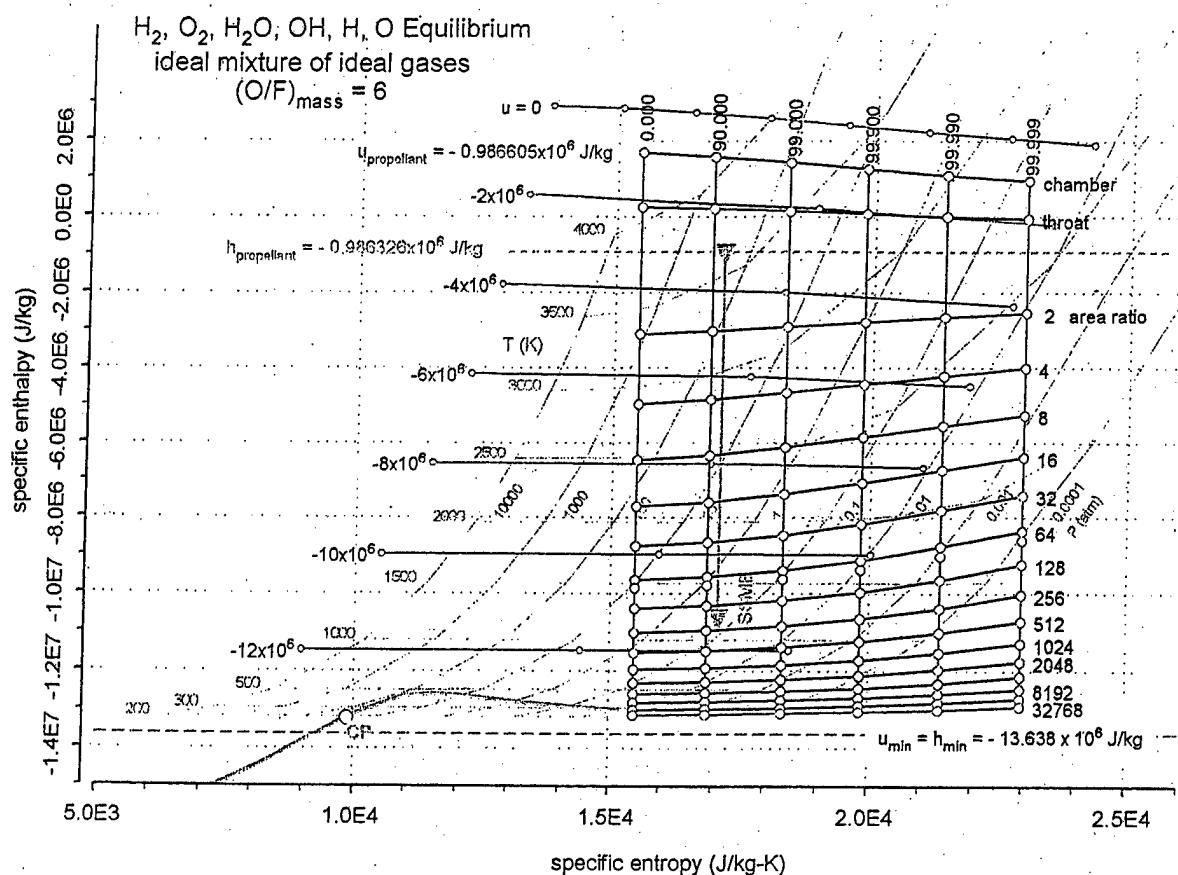

Figure 11. Comparison of Equilibrium expansion from laser heated STP air (1.18 kg/m^3) and Mach 5 air at stagnation density (5.9 kg/m^3). In the STP air diagram (on left), the circles and nearby crosses represent the blowdown quantities obtained from initial $[u_e - u^*]^*$ states of 2E3, and 1E4 J/kg for the equilibrium expansion.
